Abstract (en)  
[origin: WO2018069374A1] The invention relates to a take-up winding device for continuous winding of a multifilament bundle of fibers (34) having two drivable spool spindles (3.1, 3.2). The spool spindles according to the invention (3.1, 3.2) are arranged on a spool revolver (2), by means of which the spool spindles (3.1, 3.2) can be guided in alternation into an operating region for winding a spool (35) and a change region for removal of the spool (35). For taking up and capturing the bundle of fibers, each of the spool spindles (3.1, 3.2) has a clamping device (4.1, 4.2) on the projecting end thereof. In order to be able to take up fiber bundles with as large total titer as possible, the clamping device (4.1, 4.2) according to the invention has a clamping block (19), connected permanently to the spool spindle (3.1, 3.2), and a movable clamping plate (20), which are elastically braced together with each other to a circumferential clamping slot (24).
