Abstract (en)
[origin: WO2018069414A1] A connecting device having a hollow-body-like plug-in part (1) which is of variable outer circumference and which interacts with a fixing device (2) which is at least partially insertable into the plug-in part (1), wherein the fixing device (2) is connectable to an actuation section (3) which projects out of the plug-in part (1). Here, the plug-in part (1), with the fixing device (2) inserted therein and with the actuation section (3) connected thereto, has the minimum external shape thereof in terms of the dimensions thereof when the actuation section (3) is in a rest position. The actuation section (3) is moved by means of axial or radial movement relative to the plug-in part (1) into a working position in which the plug-in part (1) has the maximum external shape thereof in terms of the dimensions thereof, wherein the plug-in part (1) has a closed shape on its side situated opposite the insertion side of the fixing device (2).
