Abstract (en)  
[origin: WO2017220770A1] What is specified is a sliding wall arrangement with at least one wing (2) and a running rail (1) which can be sunk in a building floor and has at least one guide channel (11, 12) in which the at least one wing (2) is displaceably mounted at the lower edge. At least one covering element (5) is provided, which serves for covering the at least one guide channel (11, 12) if the guide channel (11, 12) is freed from the at least one displaceable wing (2). The at least one covering element (5) has a raised state in which it covers the guide channel (11, 12) freed from the wing (2), and a lowered state in which it is lowered into the at least one guide channel (11, 12), with the result that the at least one wing (2) can be displaced across the at least one covering element (5).
