Abstract (en)

A rotor (1) for a cylinder lock (100), comprising: a main body (2) extending along a longitudinal direction (P); a seat (3) adapted to house a key; a locking element (7) movable between a locked configuration and a disengaged configuration; a plurality of rotating elements (8) arranged inside the main body (2) and in sequence with each other along said longitudinal direction (P). Each of the rotating elements (8) is able to rotate about its own axis of rotation (51) perpendicular to the longitudinal direction (P) during the insertion of the key inside the seat (3). Furthermore, each of the rotating elements (8) has a groove (13) to receive at least a portion of the locking element (7) to allow the latter to assume the disengaged configuration. The locking element (7) is movable between the locked condition and the disengaged condition along a work direction (52) parallel to the axis of rotation (51). A further object of the present invention application is a method for realising said rotor (1).
