Abstract (en)

[origin: US2019207196A1] Disclosed herein is a pouch-shaped secondary battery including an electrode lead using a conductive polymer, wherein the electrode lead is configured to be cut in order to secure the safety of a pouch-shaped battery cell when the pouch-shaped battery cell swells due to gas generated in the pouch-shaped battery cell while the pouch-shaped battery cell is in an abnormal state or when the pouch-shaped battery cell is overcharged. It is possible to prevent electric current from flowing in the pouch-shaped secondary battery when the battery is in an abnormal state and when the pouch-shaped secondary battery is overcharged. In addition, it is possible to prevent a reduction in the energy density of the pouch-shaped secondary battery in the case in which an additional complicated device is provided in the pouch-shaped secondary battery.
