Abstract (en)
[origin: WO2018078128A1] The invention proposes a folding buckle (1) comprising a lower arm (10) and an upper arm (12) articulated relative to one another, and a return buckle (20) articulated to the upper arm (12). The buckle can take up a folded position in which the upper arm is folded on the lower arm and the return buckle is folded on the upper arm, in a longitudinal direction of the buckle. A locking system (40, 50) is in part housed between the return buckle (20) and the upper arm (12) to lock the buckle in a folded position, the locking system being able to be unlocked by a single means or a means only known by and/or available to the holder, such as, for example, a removable outer element (90).
