Abstract (en)

[origin: WO2018078212A1] : The invention relates to a method in computer assisted operation, wherein a user operates by using a keyboard of a computer, such as a PC, laptop, mobile device or the like, wherein, when the user presses a key of the keyboard, a computer hardware generates an event, whereafter a low-level driver of the keyboard is activated, which transfers the event to one or more upper-level drivers, thereafter to an operating system of the computer and furthermore finally to a program operated by the user in order to carry out the user's purpose of operation. An anti-keylogger software based on encrypting is being used for preventing malicious keylogging, wherein in order to prevent interception of the event received from the keyboard on its way to the user operated program, the whole way of communication related to the event between the low-level keyboard driver to the user operated program receiving the entered key is being encrypted by the anti-keylogger software, which includes at least an encrypting module and a decrypting module.
