Abstract (en)
A stackable nestable container (1) comprising a base (2) and an upstanding wall structure (3, 4, 5, 6), which extends away from the base (2) in an expanding manner, such that a container opening, which is defined by a rim (7) formed by the wall structure (3, 4, 5, 6), has a larger cross section than the base (2), wherein the container further comprises at least one stacking member (8), which is selectively movable between a stacking position, in which the stacking member (8) is at least partially positioned inside or above the opening to support a base (2') of another, preferably structurally identical or similar, container stacked thereon and a nesting position, in which the stacking member (8) is removed from the opening thereby enabling the other container to be nested inside the container (1). The stacking member (8) is mounted on the container (1) via at least one slide bearing (9, 10) comprising a protrusion (9), which is arranged on one of the stacking member (8) or the container wall structure (3, 4, 5, 6) and which engages with an elongate slot or groove (10) arranged on the other of the stacking member (8) and the container wall structure (3, 4, 5, 6). The slot or groove (10) and the protrusion (9) are designed such that the protrusion (9) has only one degree of freedom to move within the slot (10).
