Abstract (en)  
[origin: WO2019175107A1] The invention relates to an operating device for a construction machine, comprising a base, a manual controller, a movement sensor, and a force sensor. The manual controller is arranged at an angle to the base and can be moved in at least one dimension relative to the base. The movement sensor is designed to determine the position and/or the movement of the manual controller relative to the base and to output a movement signal depending on the determined position and/or the determined movement. The force sensor is designed to determine a force acting on the manual controller and to output a force signal depending on the determined force.
