Abstract (en)
[origin: WO2019013723A2] The present invention relates to a glass run channel (1), which prevents the noise produced by the air entering into the vehicle body through gaps, and comprises at least one seal (2), which is located at the region where two panels are joined in the vehicle body, and which, by surrounding one of the vehicle window glasses at the said region, prevents entrance of external factors between the glass and the panels, and at least one latch in the form of a fin which extends towards one of the panels over the seal (2) and exerts pressure thereon so as to stop the air entering through the region where the two panels are joined.
