Abstract (en)

[origin: WO2018091736A1] A method for operating a data network, wherein the data network contains network devices that use data connections to interchange data packets, wherein a mechanism is operated in order to determine at least one end-to-end latency between network devices, characterized in that as a mechanism a network device transmits a trigger packet to at least one further network device and a timestamp is used to establish when the trigger packet has reached this at least one further network device.
