Abstract (en)
[origin: WO2018096204A1] Disclosed is an apparatus (100) for breaking a window(150)in case of an emergency. The apparatus (100) comprises a body (106), breaking means (110) and a handle (104), wherein the body (106) is attachable to the window (150)and the breaking means (110) has a first end (110a) and a second end(110b), and it is releasably attached to the handle (104) at a second point between its second end (110b) and the middle. In the apparatus,the handle (104) has a first end (104a) and a second end(104b), and it is pivotally connected to the body (106) at a hinge point between the first end (104a) and a middle of the handle between the first end (104a) and the second end(104b), and comprises attachment means (114) for releasably attaching the breaking means (110) to the handle (104). Additionally,the position of the hinge point is arranged to cause the breaking means (110) to detach from the handle (104) when the handle (104) is pulled more than a predetermined amount.
