Abstract (en)

[origin: US2018152743A1] Described herein is an example apparatus for displaying information associated with content while streaming the content to a display device. The apparatus includes a memory having a database stored therein. The database stores metadata relating to the content. The metadata includes a trick mode index, trick mode images and a database of information associated with segments of the content. The apparatus also includes a processor communicatively coupled to the memory. In operation, in some embodiments, the processor streams the content for display on the display device. The processor implements a trick mode operation upon receiving an appropriate user request. During implementation of the trick mode operation, the processor receives command input requesting information associated with the content. Then, responsive to such command input, the processor retrieves information from the database of information associated with a segment of the content being featured on the display device when the command input was received, and displays the retrieved information on the display device.
