Abstract (en)

The rotary pump (1) comprises a driving element (4) housed in a rotor housing (31). The driving element (4) comprises a contact portion (41) comprising an spherical zone and at least one lateral driving protrusion (42) extending from spherical zone along a direction (X, Y) orthogonal to Z axis for transmitting a rotary movement to the rotor (3) around a rotational axis Z. The rotor housing (31) comprises a central recess (32) having a diameter for accommodating the contact portion (41) and at least one lateral cavity (33) intended to house the at least one lateral driving protrusion (42), such that the contact portion (41) and the central recess (32) are slidably engageable to each other for compensating angular misalignments between the Z axis and an axis orthogonal to the rotor bottom base when the rotor bottom base is resting on the chamber base and such that the at least one lateral cavity (33) is configured to allow a relative angular movement, around any direction orthogonal to Z axis, between the at least one lateral driving protrusion (42) and the at least one lateral cavity (33) required by the sliding between the central recess (32) and the contact portion (41), to keep the bottom base of the rotor (3) resting on the chamber base (21) but movable around Z axis by the pushing of the al least one lateral driving protrusion (42) against the lateral cavity (33).
