Abstract (en)
The present inventive concept relates to an attachment module (70) for supporting a lamp globe (30) having an opening for a lamp socket (90), the attachment module comprising: a central body (72) having a connecting portion (74) configured to fit the lamp socket; a plurality of elongated arms (76) extending out from the central body, wherein each one of the elongated arms is bendable in relation to the central body, such that in a first state, a respective endpoint of the elongated arms is positioned at a first radial distance from the central body whereby the attachment module can pass through the opening, and wherein in a second state, a respective endpoint of the elongated arms is positioned at a second radial distance from the central body, the second radial distance being larger than the first radial distance whereby the attachment module cannot pass through the opening.
