Abstract (en)

[origin: WO2018104286A1] The present invention relates to a mixing blade consisting of a base part (1) which can be attached to a shaft, and a wear element (8), wherein the wear element (8) is or can be releasably attached to the base part (1). To provide a mixing blade that allows the wear element (8) to be easily released from the base part (1), the invention proposes that to attach the wear element (8) to the base part (1), at least one element from the group consisting of the wear element (8), the base part (1) and an intermediate element arranged optionally at least partially between the wear element (8) and the base part (1) is elastically deformed such that it exerts a force on another element from the group.
