Abstract (en)

[origin: WO2018105603A1] The invention relates to an electric compressor that extends along a longitudinal axis and comprises at least one casing housing at least: - a mechanism for compression of a coolant fluid, - a drive unit arranged inside the casing and that drives the compression mechanism, - a module for control of the drive unit, - at least one electric connector (16) intended to connect the control module electrically to an energy source outside the compressor, and - a cover (13) comprising a metallic part (22) and a synthetic part (23) arranged one against the other along the longitudinal axis and traversed by the electric connector (16), characterised in that at least one sealing device (28) is arranged between the metallic part (22) and the synthetic part (23), the sealing device (28) extending around an electric connector (16).
