Abstract (en)
[origin: KR20180074567A] Provided are a system for providing a to-do-list of a user and a method thereof. The system for providing a to-do-list of a user and the method thereof determine a task in a to-do-list of a user based on the operation of a service providing server which a device of the user or the user joins. A device for providing a to-do-list of a user includes: a communication unit communicating with an outer device; a display unit; and a processor determining one or more keywords used to determine at least one task which the user will perform in the to-do-list, based on data obtained by an application executed on the display, and generating a keyword list about the one or more determined keywords, wherein the processor displays a GUI for selecting the one or more keywords in the keyword to-do-list by controlling the display. In this case, the device for providing a to-do-list of a user can determine the at least one task which the user will execute by using a rule-based algorithm or an artificial intelligence algorithm. When the device for providing a to-do-list of a user determines at least one task using the artificial intelligence algorithm, the device can use a machine learning algorithm, a nerve network algorithm, or a deep learning algorithm.
