Abstract (en)  
[origin: WO2018108892A1] To present a ball type massager that continuously stimulates a single pressure point while the ball is gently rolled in the desired direction on the pressure point. A ball type massager comprising a ball (11) for massaging by pressing against the body, a string-like first ball operating component (12) on the surface of this ball spanning the pair of first intersections joining with the first ball axis, a string-like second ball operating component (13) on the surface of this ball spanning the pair of second intersections joining with the second ball axis that is perpendicular to said first ball axis. As a result, it is possible to continuously stimulate a single pressure point while the ball is gently rolled in the desired direction on the pressure point.
