Abstract (en)

[origin: WO2018108858A1] The invention relates to a method for actuating a motor-driven closure element assembly (1) of a motor vehicle (2). The closure element assembly (1) has a closure element (3), a control assembly (5), and a sensor assembly (6), and the sensor measurement values of the sensor assembly (6) are monitored by means of the control assembly (5) in order to determine whether a trigger operating situation is present which is defined by at least one operating situation condition. If the trigger operating situation is detected by means of the control assembly (5), an actuation of the closure element assembly (1) is triggered. A portable haptic signal transmitter (7) is provided, and in at least one specified triggered state of the control assembly (5), haptic information assigned to the triggered state is transmitted via the signal transmitter (7).
