Abstract (en)

[origin: WO2018108723A1] The present invention relates to the field of the interception of electromagnetic signals. It more particularly relates to a method for manufacturing a two-dimensional radio-direction-finding antenna array comprising a step of designing said antenna array depending on preset constraints, said designing step comprising: a step (21) of defining a reference antenna array; a step (22) of searching for configurations to take into consideration for each of the antennae of a distance-finding antenna array; a step (23) of quantifying the maximum ambiguity level of each of the possible configurations on the basis of a correlation function in order to associate, with each of the configurations considered, an evaluation quantity; and a step (24) of searching for and selecting the configuration having the lowest evaluation quantity.
