Abstract (en)

[origin: CN209507435U] The utility model relates to a control switch (1) for operating a crane. The utility model relates to a crane, comprising a housing (2) extending in a longitudinal direction (L), on a front side (2a) of which a control panel (3) having at least one control element (3a, 3b, 3c, 3d) is arranged, in particular for controlling the horizontal movement of the crane, said front side being delimited by two opposite longitudinal sides (2c, 2d). In order to provide a control switch (1) having optimal ergonomic properties in order to achieve a particularly comfortable and safe crane operation, it is proposed that the longitudinal sides (2c, 2d) have a first running profile (13a) that is biconvexly curved in the longitudinal direction (L) of the housing (2) in the region of the first control panel (3).
