Abstract (en)

[origin: WO2018114180A1] The invention of the present application relates to non-invasive equipment for monitoring blood flow and/or respiratory cycles of a human or animal body, comprising at least one segment of conductive elastomer of variable resistance, which is arranged to extend about the circumference of the body element and is sensitive to the length of the circumference of said element, means for capturing said length by virtue of said variable resistance and supplying a signal representative of said length, and means for processing said signal, having means of extracting the parameters of the blood flow and/or of the respiratory cycles that are to be monitored.
