Abstract (en)

[origin: WO2018114042A1] The invention relates to a cigarette magazine for a cigarette-packaging machine, having one or more groups (13) of shafts each having a plurality of shafts (14) which are arranged one beside the other, are bounded in each case by shaft walls (15) and along which cigarettes (11) can be conveyed under their own weight substantially parallel to the shaft walls (15). The invention is characterized in that a plurality of, or all, the shaft walls (15) of one or each group (13) of shafts, that is to say in each case end sides of the shaft walls (15), are operatively connected to at least one common vibration plate (18), which is mounted in a movable, in particular freely oscillating, manner and can be made to vibrate by a vibration generator (21), such that the vibrations of the vibration plate (18) can be transmitted to the shaft walls (15) during operation.
