Abstract (en)
[origin: WO2018208255A2] The cleaning equipment (A) developed comprises the body (A1) through which the water may pass; the water outlet (A2) where the water passing through the body (A1) is delivered to the user; the sensor (A3), which detects the presence of an object; the automatic flow mode in which the flow of water is enabled upon the sensor (A3) detecting the presence of the object; the manual flow mode in which the flow of water is controlled only by the contact of the user; the mixed flow mode in which the flow of water is able to be controlled both by the user's contact and in a non-contact manner; the first adjustment member (A4), which enables, via rotational motion about an axis, the adjustment of the temperature of the water to be delivered to the user via the water outlet (A2); the second adjustment member (A5), which enables, via rotational motion about an axis, the adjustment of the flow rate of the water to be delivered to the user via the water outlet (A2) in all the flow modes; the control unit (K), which determines the extent of rotation of the adjustment members and accordingly enables the adjustment of the temperature and the flow rate for the water to be delivered to the user; and the switch (B), which is connected to the control unit (K), is able to be triggered mechanically or in a touch-operated manner by means of the first adjustment member (A4) and/or the second adjustment member (A5) and enables, upon being triggered, the switching to be performed between the flow modes or the flow of water to be controlled in the manual flow mode.
