Abstract (en)
[origin: WO2018115670A1] The invention relates to a light-emitting device (100) comprising: at least one light-emitting structure (110) comprising a first side and a second side that are essentially parallel; a first electrode (160, 170) making contact, via a contact area, with either one of the first and second sides, the device being characterized in that the first electrode (160, 170) is shaped so as to cause a decrease in, from a first region and in the direction of at least one second region of the contact area, a current density that is liable to flow through the light-emitting structure (110).
