Abstract (en)

[origin: WO2018145884A1] The invention relates to a method for operating a heat pump installation (1) in which method a working fluid circulates within a directed working circuit (100) of the heat pump installation (1), the working fluid is compressed by means of a compressor (20,...,25) and is condensed by means of a condenser (4), a mass flow of the working fluid upstream of the feed line is divided over a first and a second evaporator (31, 32) (102) and supplied in parallel to the first and the second evaporator (31, 32) and the working fluid is evaporated at a first evaporation pressure (411) in the first evaporator (31) and at a second evaporation pressure (412) in the second evaporator (32), which pressure is reduced by comparison with the first evaporation pressure (411). According to the invention, the first evaporator (31) is coupled thermally with a first heat source (41) having a first heat source temperature and the second evaporator (32) is coupled thermally with a second heat source (42) which has a second heat source temperature, which is lower than the first heat source temperature.
