Abstract (en)

[origin: EP3563702A1] The present invention refers to a device (100) specially designed to provide rigidity and fall to textile garments, which is constituted by a laminar body with a globally rectangular cross section that at one of its ends has an angled tip (101), where said tip has at its end a rounding (102) which is responsible for shaping said tip, also has a beveled profile (103); in its middle section (104) it has a rectangular shape and is arranged to give an exact dimension to the size of a piece of fabric; in an area proximal to the lower part there are two pointed endings (105) located in each of the ends that in its lower part has a tongue (106). The invention also relates to a portion of fabric comprising said device and a garment.
