Abstract (en)
Adjusting elements (4) of the regulator with multiple valves (1) are mutually coupled, preferably they are coupled by the mechanical draw rod (12) with a lock (14). The axes of the valves (1) are placed in a single plane which is perpendicular to the direction of the fluid's flow. The regulation spaces of individual valves (1) are separated by the partition (8) which is placed between the neighboring valves (1). In the preferable arrangement the valves (1) and the adjusting mechanisms (16) of all valves (1) are the same. The valve (1) of the regulator has the adjusting mechanism (16) which includes a valve's (1) lever (2), a spring (3), a damper (5) and the adjusting element (4) for the change of the spring's (3) prestress. The spring (3) connected with the adjusting element (4) acts upon the valve's (1) lever (2). The arm (7) of the damper (5) has a curved groove (9). The groove's (9) shape is comprised of two continuous sections, where the first section of the groove (9) is led by straight line, while the second section is curved.
