Abstract (en)  
[origin: WO2018127318A1] The invention relates to a valve arrangement having a valve housing (2) comprising a lower and an upper housing part (2a, 2b), in which valve housing (2) a flow channel (3) having a flow chamber (3b) is formed, and comprising a blocking device associated with the flow chamber (3b) to close the flow channel (3). The housing parts (2a, 2b) can be rotated relative to each other about a common vertical axis of rotation (X) and are releasably connected to each other in defined relative positions. In the lower housing part (2a) at least one transversely extending end channel section (3e) is formed that extends transverse to the axis of rotation (X) between an opening provided in the circumferential wall of the lower housing part (2a) to let a fluid (4a) in or out and a lower vertical channel section (3a), and/or in the upper housing part (2b) an end channel section (3f) extending transversely is formed that extends transverse to the axis of rotation (X) between an opening provided in the circumferential wall of the upper housing part (2b) to let a fluid (5b) in or out and an upper vertical channel section (3c).
