Abstract (en)

[origin: WO2019215045A1] The invention relates to a method for dynamic nip control during flexible rolling of metallic strip material, having the following steps: specifying (V10) a target thickness profile (1) having defined target corner points (E) and profile sections (2', 2'', 3', 3'') therebetween, each pair of profile sections which adjoin at a target corner point having different average gradients; flexibly rolling (V40) the strip material (11) according to the target thickness profile (1); measuring (V50) an actual thickness profile (14) of the flexibly rolled strip material (11'); determining (V60) actual corner points (E') corresponding to the target corner points (E) and actual intermediate points (S') corresponding to the target intermediate points (S); determining (V70) corner point comparative values ( $\Delta D$ ,  $\Delta L$ ) from the target corner points (E) and the corresponding actual corner points (E') and intermediate point comparative values ( $\Delta D'$ ,  $\Delta L'$ ) from the target intermediate points (S) and the corresponding actual intermediate points (S'); controlling (V80) a nip (12) in accordance with the corner point comparative values ( $\Delta D$ ,  $\Delta L$ ) and the intermediate point comparative values ( $\Delta D'$ ,  $\Delta L'$ ).
