Abstract (en)
[origin: CN110498274A] The invention relates to a transverse cutting device (10) of a winding machine (1). The transverse cutting device extends and is constructed transversely to the conveying direction of the fabric web. For a cutting process of a fabric web, the transverse cutting device at least partially pivots into the plane of the fabric web from a static position; the transverse cutting device comprises at least one cutter (13) and a pressing device (14). The cutter (13) is arranged to be displaceable along a guide (12) orthogonally to the conveying direction of the textile web, said pressing device interacting continuously with the cutter (13) during cutting, the pressing device (14) being designed to be transferred from an operating position into a receding position.
