Abstract (en)
[origin: EP3569567A1] The invention relates to a horse-riding rein folded in two sections (3A) (3B), capable of acting as a fixed or sliding rein by incorporating a blocking ring (1) that relates both sections, anchored in the first section (3A) at a point close to the passage of the rein through the ring (4) of the horse's bit, and being crossed by the second section (3B) that returns from the ring (4) to the hand (M) of the rider. When the horse keeps its head in front of the vertical, the two sections (3A) and (3B) of the rein are tense, with the blocking ring (1) distanced from the ring (4), acting as a sliding rein, exerting force and tension on the equine's mouth with a pulley effect. When the horse picks up its head approaching it with the vertical, the ring (4) approaches the blocking ring (1) that acts as a stop, canceling the tension of the first or section (3A) of the rein, while the second section (3B) remains in tension, acting the reins as fixed reins.
