Abstract (en)
[origin: WO2018133976A1] The invention relates to a printing press which has at least two units (400; 600; 800) in the form of modules (400; 600; 800), at least one of which is in the form of a non-impact coating module (600) and has at least one printhead (616). The at least two modules (400; 600; 800) each have at least one dedicated drive (M400; M600; M800) which is used to effect transport of substrate through the module (400; 600; 800) in question and/or the effective region thereof. Along an intended transport path, there is at least one first application point (618), provided for coloured coating agent, of at least one non-impact coating module (600), and then an effective region of at least one drying device assigned to the first application point (618), and then at least one further application point (618), provided for coloured coating agent and preferably oriented towards the same side, of at least one non-impact coating module (600), and then an effective region of at least one further drying device assigned to the further application point (618). At least one printhead (616) is preferably connected and/or connectable to at least one positioning device, and the at least one positioning device preferably has at least one positioning drive.
