Abstract (en)

[origin: WO2018138340A1] The invention relates to a meteorology method for detecting and/or forecasting convective atmospheric systems (2) in the atmosphere (3) of a planet according to radiance data acquired by means of at least one radiance sensor (18) and representing the radiance emitted by a surface (6) of the planet and/or clouds (8) present in the atmosphere, and/or radar surface data acquired by means of at least one radar (20) and representing the state of the surface of the planet. The method comprises the detection of a convective atmospheric system (2) according to both the radiance data and the radar surface data, and/or the digital forecasting of a convective atmospheric system (2) with digital assimilation of the radar surface data or according to both the radiance data and the radar surface data.
