Abstract (en)
[origin: WO2018141326A1] The problem addressed by the invention consists in specifying a structural form for a plug connector housing having a socket housing (1) and having a screw attachment (2) held rotatably thereon, which ensures increased stability with respect to tensile and lever forces (F), in particular under the action of vibration and regular and/or individually occurring shocks. Said problem is solved by means of a plug connector housing having a socket housing (1) and a screw attachment (2), wherein the socket housing (1) has an outer surface of circular cross section with an encircling first groove (11) formed therein, and wherein the screw attachment (2) has an inner surface of circular cross section with an encircling second groove (22) formed therein, and wherein the plug connector housing furthermore has a circlip (5) which is arranged with its inner circumference in the first groove (11) and with its outer circumference in the second groove (22) in order to hold the screw attachment (2) rotatably on the socket housing (1).
