Abstract (en)

[origin: US2019365020A1] A sports shoe has a lower boot portion to receive the user's foot and an upper boot portion to receive the user's lower leg. In the process, at least one first sensor in a front foot portion of the sole assembly is connected with at least one second sensor in a heel portion of the sole assembly via a multipolar flexible flat cable having an adjustable length as needed, such that a distance between the at least one first and second sensors can be adjusted to various sole lengths during the manufacturing of the sports shoe. This can be specified correspondingly for at least one third or fourth sensor in the upper boot portion and the at least one first or second sensor on the sole assembly of the sports shoe, such that an adjustment to the upper boot portion with various model-dependent height dimensions is facilitated during manufacturing.
