Abstract (en)
[origin: EP3578279A1] A hydraulic forging press unit having devices arranged in a building-block-type is provided, in which the devices of the hydraulic forging press unit, after being classified, are arranged in a three-dimensional way in different layers to form a building-block-type arrangement structure. A main device (1) is placed in a left chamber on a basement first floor (a), and runs through left chambers on the basement first floor (a), a first floor (b), a second floor (c), and a third floor (d); a hydraulic pump station is placed in a right chamber on the basement first floor; an electronic control system is placed in a right chamber on the first floor; an intelligent conversion system for hydraulic power source is placed in a right chamber on the second floor; and an intelligent filtration and cooling system is placed in a right chamber on the third floor. With the present disclosure, area occupied by the devices are reduced, and hydraulic transmission pipelines are shortened as much as possible so as to reduce a hydraulic transmission resistance and further to improve a dynamic response speed of a hydraulic system, with the advantages of high manufacturing efficiency and a low running cost for enterprise; besides, after arranged in different layers the devices are arranged in reasonable positions, which facilitates maintenance of the devices, moreover, underground and overground spaces are comprehensively utilized in the present disclosure, thereby the noise caused by vibration of the devices is reduced.
