Abstract (en)

[origin: CA3051158A1] Orthopaedic foot bed (1) for a shoe (2) with a foot support surface (3), wherein the foot support surface (3) is formed by a plane base surface (4). The foot bed (1) has a multiplicity of knobs which are distributed in a predefined manner and by which the stimulation points in the sole are stimulated in a targeted manner, as a result of which the neurological, biotensegrity and liquid-dynamic system of the human body can in turn be improved. Through the improvement thereby achieved, it is possible to address and improve certain aspects of human health, which in particular include the gait pattern and posture of the human body. Moreover, by means of the invention, the transport of the lymphatic and venous liquids ("heart of feet function" of the sole) can be excited and intensified.
