Abstract (en)
[origin: CA3052228A1] The invention relates to a chassis suspension (10) for rail vehicles (36), the chassis suspension comprising a carriage body (12) which is supported on a chassis (16) via a spring system (18), the chassis suspension (10) having an anti-lift device (24) with a stop element (30) fixed in respect to the carriage body (12) and a stop element (28) fixed in respect to the chassis (16), between which stop elements free play exists which limits the rebound travel of the spring system (18) if the carriage body (12) is raised. The invention is characterised in that a level-adjustment device for the carriage body (12) is formed by an extendable actuator (34) positioned between the two stop elements (28, 30).
