Abstract (en)
[origin: WO2018192829A1] The invention relates to a fitting assembly for windows, doors, or the like having a length-adjustable locking bar, which comprises a first and a second partial bar. The partial bars can be slid relative to each other along a longitudinal axis of the locking bar. Toothings are provided on the first partial bar, and counter toothings are provided on the second partial bar, which toothings and counter toothings are designed to mesh with each other in order to fix the two partial bars relative to each other in accordance with the desired length of the locking bar. The mating toothings are mounted on the second partial bar for rotation about an axis of rotation between a blocking position, in which the mating toothings mesh with the toothings, and a release position, in which the mating toothings release the toothings for sliding of the partial bars relative to each other.
