Abstract (en)
[origin: WO2018146100A1] A device for testing the temperature resistance of a pump, comprising a main circuit that is provided with means for connecting to the pump to be tested and is intended to contain a test fluid, the main circuit being connected: - by at least one first valve to a first heat exchanger connected to a first secondary circuit carrying a first heat transfer fluid, the first secondary circuit being associated with first means for maintaining the first secondary fluid at a first predetermined temperature; - by at least one second valve to a second heat exchanger connected to a second secondary circuit carrying a second heat transfer fluid, the second secondary circuit being associated with second means for maintaining the second secondary fluid at a second predetermined temperature.
