Abstract (en)

[origin: WO2018192778A1] The invention relates to a rail vehicle for transporting persons, comprising at least one outer door (1) and a door region (4) lying behind the outer door and to a method for operating the rail vehicle. The rail vehicle has a movable first floor section (5, 5') and a stationary second floor section (6) in the door region (4), wherein the first floor section (5, 5') is mounted in a pivotal manner relative to the second floor section (6) about a horizontal first rotational axis (7) parallel to a longitudinal axis of the rail vehicle such that a first end face of the first floor section (5, 5'), said end face facing the outer door (1), can be raised and/or lowered, in particular during travel, in order to bridge a height offset between a platform (10, 10') and the second floor section (6).
