Abstract (en)  
[origin: WO2019110162A1] The invention relates to a door, which has a guide rail assembly, which has two guide rails arranged in the region of the lateral edges of the door leaf, which lateral edges extend parallel to the specified path, each of which guide rails has a first portion, which extends substantially linearly approximately parallel to a lateral edge of the door leaf in the closed position approximately in the direction of gravity, a second portion, which extends substantially linearly parallel to a lateral edge of the door leaf in the open position and approximately in a horizontal direction, and an arcuate portion, which connects the linear portions to each other, wherein, in the region of the end of the second linearly extending portion that is remote from the arcuate portion, a preloading device is mounted, which forces the door leaf in the open position toward the closed position and which is fastened with respect to the second linearly extending portion by means of a fastening device, characterized in that the fastening device comprises a insertion connection assembly, in particular a fastening tab that can be inserted into a corresponding receptacle.
