Abstract (en)
A compressor that reduces the amount of oil circulating in a refrigeration cycle by improving the function of separating oil from a medium in the compressor is provided.[Solution to Problem]A discharge chamber 24 is divided, by a dividing wall 6d formed in a rear housing 6 in a vertical direction, into a first discharge chamber 24a in which a discharge outlet 18d is formed and a second discharge chamber 24b in which an introduction passage 25 to an oil separation chamber 28a of an oil separator 28 is formed. A passage 27 that makes the first discharge chamber 24a and the second discharge chamber 24b communicate with each other is formed in an upper part of the discharge chamber 24.
