Abstract (en)

[origin: WO2018154204A1] The present invention relates to a casing, notably for a telephone, comprising two shells (1) that close onto one another and a slide (4) that is movable in translation on the first shell and has a coupling member (41, 42) for coupling to the second shell, the casing being designed such that when the casing is closed: - a coupling member is coupled to the second shell when the slide is in a first position (P1) or in a second position (P2), - the coupling member(s) is/are free when the slide is in a third position (P3). The casing also comprises a device for locking the slide on one of the shells in the first position, said device being actuatable only by a dedicated tool, and immobilization means (12, 13, 43) for reversibly immobilizing the slide in the second and in the third position.
