Abstract (en)

[origin: WO2018184605A1] The invention is to provide an efficient transportation possibility for mirror units which is reliable and cost-effective in equal measure<sb />. This is achieved in that end panels (10) are first attached to the end faces of the mirror units such that a plurality of said end panels complement one another so as to form a transport device with which the mirror units can be assembled in order to form a transport unit. The end panels form a support frame, which can be anchored in base rails (20), in a manner similar to a jigsaw puzzle, said support frame allowing a secure and simple transport of multiple mirror units on a narrow space.
