Abstract (en)  
[origin: WO2018153861A1] A device for presenting goods comprises at least one compartment (1) in which goods (2) are stocked, wherein at least one of the goods (2) can be removed from the at least one compartment (1) via a motor-driven ejector or can be removed from the compartment (1) manually. At least one weight sensor (3) is provided on the at least one compartment (1), by means of which weight sensor the weight of the goods in the compartment (1) can be detected. The at least one weight sensor (3) is connected to a control unit, which calculates the number or amount of goods (2) in said compartment (1) as a function of the measured weight of the goods (2). Digital detection of removal of goods is therefore possible.
