Abstract (en)
[origin: WO2018153733A1] The invention relates to a conductor connection terminal, comprising an insulating-material housing, a spring-force clamping connection point, which is arranged in the insulating-material housing and which has a clamping spring, and comprising a pivotably mounted actuating lever for actuating the clamping spring, the actuating lever being movable from a closed position into an opened position and vice versa, the actuating lever having a driver element for deflecting a clamping leg of the clamping spring in order to open a clamping point of the conductor connection terminal, which clamping point is formed with the clamping leg, the conductor connection terminal having at least one spring-holding element, which is not arranged on the actuating lever, for holding the clamping leg in the opened position, such that the actuating lever is not loaded with the restoring force of the clamping spring when the clamping point is in the opened state, the conductor connection terminal having at least one spring-releasing element arranged on the actuating lever, which spring-releasing element can be coupled to the spring-holding element during at least one segment of a restoring motion of the actuating lever from the opened position into the closed position, whereby the at least one spring-holding element is mechanically actuated by the at least one spring-releasing element in order to release the clamping leg held on the at least one spring-holding element.
