Abstract (en)

[origin: WO2018158033A1] The invention relates to a transmission arrangement (1), comprising a separating housing element (2), which is designed to subdivide the transmission arrangement (1) into at least one wet chamber (NR) and at least one dry chamber (TR), at least one torsion damper (3) for damping torsional vibrations, at least one disconnection device (4) for disconnecting the torque flow of a drive from a transmission input shaft of the transmission, and a damper device (6), wherein the damper device (6) is arranged in the torque flow between the secondary side of the at least one torsion damper (3) and the primary side of the disconnection device (4), wherein at least one torsion damper (3) is arranged in the dry chamber (TR) and at least one disconnection device (4) is arranged in the wet chamber (NR), and wherein an attachment device for an electric motor is provided, which is arranged in the radial direction above the least one of the devices (6, 4), in the same axial plane.
